

## Powerful Daily NDS Management With a "Safety Net"

### EASY COST JUSTIFICATION

**“The planning [DS Standard] enables now is worth its purchase...we wouldn’t recommend the installation of NetWare 4.x without a tool like DS Standard.”**

**-- The Burton Group, Cover Story**

At PSI, we focus on building premier tools that provide network administrators and managers with a better way to manage their Novell networks. All of the PSI products are built to reduce the costs of managing your Novell network.

By adding significant capabilities over the tools that come with NetWare, experts have found that DS Standard is easy to cost justify. A few ways to save using DS Standard include:

- ◆ **Reducing administration time with database commands**
- ◆ **Focusing network managers on more strategic issues**
- ◆ **Reducing or eliminating downtime, after hours and weekend work**
- ◆ **Enhancing security reporting abilities**
- ◆ **Adding mass change capabilities**
- ◆ **Adding more flexible tree management capabilities**

### SMART NETWORKING WITH THE PSI SUITE

**“Hewitt Associates has site licensed all of PSI’s products for use worldwide. Used together, they are the framework to better manage our enterprise.”**

**--Linda Brown, Hewitt Associates**

The PSI Suite (Origen, AuditWare and DS Standard NDS Manager) helps NetWare administrators **work smarter**. The products in the PSI Suite are integrated, providing more powerful capabilities when combined. Like DS Standard, you will find AuditWare and Origen are a must for any network administrator.

**Origen** is a tool for managing NetWare server binderies. Think of it as a more powerful, off-line Syscon and Pconsole tool rolled into one. While working off-line with Origen, network administrators can: template server installations, consolidate servers by merging objects, apply naming conventions with powerful database commands (e.g. global search & replace), define entire print configurations from print jobs through print servers, move users from server to server and perform pre-configuration analysis through detailed reports.

**AuditWare** is a Windows-based bindery reporting tool. AuditWare's WYSIWYG interface provides network administrators with the capability of running consolidated bindery reports for multiple servers, off-line. For each report, AuditWare accesses information from the off-line PSI database, not the "live" NetWare server. Unlike other bindery reporting tools, every time a report is run with AuditWare, there is no CPU performance impact and no additional network traffic. Additionally, AuditWare's Windows-based custom report writer enables exception reporting and provides an extensible architecture that allows external databases to be linked into any report.
